

# List

## Overview

- A list is a user defined data type which will be used in Quality "**Property**" configuration
- List is configured with a name and multiple values
- When property is set as "**List**" data type and associated with a list, the values of the list will be the possible values for the property
- Quality "**List**" configuration screen can be accessed by clicking on "**List**" option under "**Quality**"
- Quality "**List**" configuration screen is shown below with sample lists

## List Configuration

- New list can be configured by clicking on "**New**" menu option
- Existing list can be configured by clicking on "**View**" after selecting the list
- Each list will have a "**List Name**" and multiple list items.
- Each list item will have List Item name, Active status and the default list item selection
- List Configuration screen is shown below
